PROFESSIONAL SUMMARY

Computer Science undergraduate who ships finished software rather than prototypes. I have delivered a full-stack commercial website for a paying client, and published four games and a paid developer tool under my own studio label, crimSun — two of the games run in a web browser with nothing to install, and the tool sells as a commercial asset. I work across the whole stack: interfaces people use, the services and databases behind them, and the systems that decide what happens in a game.

Comfortable owning a feature end to end, from the idea through the architecture to a release someone can actually use. Equally comfortable explaining that work to people who do not write code.

EDUCATION

Bachelor of Science, Computer Science

Southern New Hampshire University (SNHU) — in progress, graduating mid-2027

Coursework: Data Structures & Algorithms, Systems Architecture, Object-Oriented Programming, Software Engineering Principles, Databases, Operating Systems.

31 skill credentials independently verified through Credly, including Python, Java, Algorithms, Software Architecture, Systems Design, Database Design and SQL. Additional coursework passed in Calculus I–III and Differential Equations.

WHAT I BRING

Ships to completion. A live client website plus five public releases in two years, while studying full time. Everything below is online and can be opened right now.

Works across the stack. Front end, back end and database on real client work; engines, editor tooling and rules systems on my own.

Works solo, end to end. Design, build, test, package, publish, document. No handoffs available; none needed.

Translates the technical. I write documentation and record explanations for non-specialist audiences, and I have grown an audience doing it.

Learns fast, in public. Self-taught from a school HTML assignment in 2018 to shipping commercial tooling, with the work visible at every step.

TECHNICAL SKILLS

Languages C#, C++, Python, Java, TypeScript, JavaScript, GDScript, SQL, HTML, CSS

Web & data Full-stack development, PostgreSQL, REST APIs, responsive front ends, deployment

Engines & tools Unity, Godot, Unreal Engine (C++ and Blueprints), Git and GitHub, Vite

Engineering Object-oriented design, finite state machines, systems architecture, algorithmic optimisation, memory management, WebGL build optimisation, REST APIs, database design

Practice Competitive programming on LeetCode, Codewars and CodinGame (C++, Java, Python)

SELECTED PROJECTS

k-nity.com — full-stack client website PostgreSQL · deployed

A commercial website built end to end for a Jakarta company running study and performing-arts programmes in Korea. Their first real online presence, and the first place their customers can apply.

- Built the front end, the back end and the database, then deployed and maintained it — sole developer on the project.

- Designed a multi-step application flow that collects and validates applicant details and tracks each application through its stages.
- Modelled the data in PostgreSQL so programmes, intakes and applications stay consistent as the business adds new offerings.
- Delivered a media-heavy marketing site that stays fast, and an admin view the client can operate without a developer.

crimSun Power Engine — universal power and levelling system TypeScript · Vite

A configurable rules engine that resolves a contest between two characters and explains its own result. Built as the shared backbone for my games so balance changes happen in one place instead of five.

- Implemented CR-compression, two-zone sigmoidal damage and a five-tier resource system, resolving both sides in a single pass.
- Surfaced every step of the calculation in a live interface so designers can see why a result happened, not just what it was.
- Ships as a self-contained browser application with no server and no install.

VERA AI — Godot editor plugin Sold on itch.io

A developer tool that catches broken game logic before the game is run, sold as a commercial asset.

- Wrote a GDScript static analyser that validates AI state-machine transitions inside the editor and flags faults inline.
- Designed it to run at edit time only, so it adds zero cost to the shipped game.
- Packaged, documented and published it independently, including support material for buyers.

Sunnyside World — 2D survival sandbox Unity · playable in browser

An open-world survival and farming game that runs in a browser tab with no download.

- Built the full loop: resource gathering, crafting, a day and night cycle, and world state that persists between sessions.
- Separated inventory, farming and time systems into independent modules so each could change without destabilising the others.
- Tuned the asset pipeline and scenes for WebGL export to keep load times viable in-browser.

Tiny Swords Last Stand — tower defence Unity / Godot · playable in browser

A ten-wave defence game with difficulty that designers can retune without touching code.

- Drove wave pacing from a data configuration rather than hard-coded values, so balancing is a data edit.
- Built enemy behaviour as a finite state machine (approach, attack, retreat) designed to extend to new enemy types cheaply.

Dragon Ball Sol — Unity prototype Source on GitHub

A combat prototype driven by the Power Engine, with live power, form and resource values wired into an in-game combat interface — proof the rules system works inside a real game, not in isolation.

OPEN SOURCE & TOOLING

crimSun-chrome-mcp TypeScript implementation of a Model Context Protocol integration for browser-based tool workflows.

academic-assignments-project-portfolio Coursework and technical assignments from the Computer Science degree, published openly.

AUDIENCE & COMMUNICATION

I run two YouTube channels covering competitive gameplay, reviews and travel. One video I produced was credited by a game server's own published history with taking it from roughly 250 daily players to 550–600 within two weeks, and with doubling that channel's subscriber base — evidence I can make technical subject matter compelling to a general audience, at scale. I am also ranked first on two competitive leaderboards, at a 14:1 win-to-loss ratio across roughly 3,300 recorded matches.
